6. User Feedback ..... page 6
7. Costs and Revenue ..... page 7
8. Next Steps and Limitations ..... page 8

About this report

This is the final report of the Rivertown Bike-Share Pilot. It is written for the Rivertown City Council, the Urban Mobility Office and the operations contractor, and it sets out what the pilot found so that decisions about the service can be based on evidence.

Item	Detail
Document	Final report
Prepared by	Rivertown Urban Mobility Office
Audience	City council, Urban Mobility Office, operations contractor
Status	Final

Key terms

Docking station: a fixed rack where bicycles are unlocked and returned. **Trip:** one ride from unlocking a bicycle to returning it. **Registered user:** a person who has created an account for the service. **Rebalancing:** moving bicycles between stations so that docks are neither all empty nor all full.

1. Executive Summary

This report summarises the Rivertown Bike-Share Pilot, a six-month trial of a public bicycle sharing service. It covers usage, station performance, safety, user feedback, costs and recommended next steps.

The pilot was designed to give the city practical evidence about how residents use shared bicycles, what it costs to run a service of this kind, and where operations need to improve before any decision is made about a permanent scheme. The sections that follow set out the findings in the order in which they were collected: usage, station performance, safety and maintenance, user feedback, and costs. The final section describes the limits of the evidence and the recommended next steps.

Each section is written so that it can be read on its own. Figures are taken from the pilot's operating records, the maintenance log and the end-of-pilot user survey, and are rounded where stated.

2. Pilot Overview

The Rivertown Bike-Share Pilot ran for six months, from 1 March 2025 to 31 August 2025. The pilot deployed 400 bicycles across 25 docking stations. It was funded by a municipal grant of INR 2.4 crore. By the end of the pilot, 12,500 users had registered for the service.

The pilot was managed by the Rivertown Urban Mobility Office, with day-to-day operations handled by an operations contractor, CycleWorks Ltd.

Background

Rivertown launched the pilot to test whether a docked, pay-per-ride bicycle service could work in the city. Before the launch, the Urban Mobility Office agreed on four objectives: to measure how many people would register and ride, to test day-to-day operations such as maintenance and rebalancing, to understand the real cost of running the service, and to collect feedback from riders.

The bicycle network

Bicycles were single-speed models with a front basket and puncture-resistant tyres. They could be unlocked at any docking station using the mobile app or a registration card, and had to be returned to a docking station to end the trip. The 25 stations were placed beside transport interchanges, markets, parks and residential neighbourhoods. Each station had a set of docks and a payment and information panel.

Registration, fares and operations

Users registered once, through the mobile app or at a station panel, and a per-trip fare applied to every ride. Station staff, maintenance crews and the customer helpline were provided by the contractor. Crews moved bicycles between stations during the day so that docks did not stay completely empty or completely full.

3. Usage Data

Riders completed 186,000 trips during the pilot. The average trip lasted 18 minutes. Weekday trips made up 71% of the total. Commuters accounted for 62% of trips; the remaining 38% were recreational. Demand peaked between 8 and 10 AM and between 5 and 7 PM.

Weekend trips made up the remaining 29% of the total. Over the 184 days of the pilot, this works out at about 1,000 trips per day. A trip was counted each time a bicycle was unlocked and later returned to a docking station. Trips were classed as commuter or recreational using the time of day and the start and end stations.

Trips by month

Month	Trips
March 2025	21,000
April 2025	27,000
May 2025	33,000
June 2025	35,000
July 2025	36,000
August 2025	34,000
Total	186,000

Table 1: Monthly trips during the pilot.

Monthly trips rose from 21,000 in March 2025 to a high of 36,000 in July 2025, before easing to 34,000 in August 2025. Usage increased in every month from March to July.

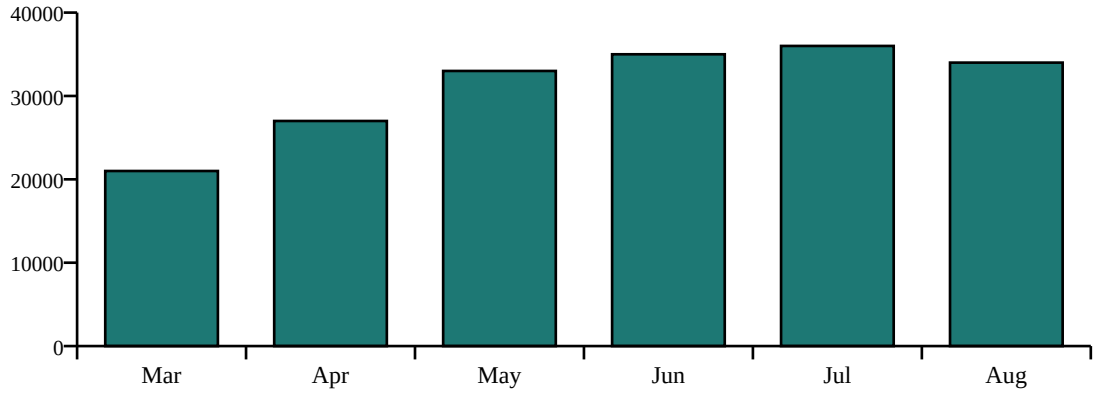

Figure 1: Trips per month, March to August 2025.

4. Station Performance

Central Station was the busiest location, accounting for 14% of all trips. The five busiest stations together handled 48% of all trips. The quietest station was Old Fort, with 2,230 trips. The remaining 20 stations handled 52% of all trips.

Stations varied in size, with between 12 and 24 docks each. Trips were concentrated at stations beside transport interchanges, which is also where crews most often needed to move bicycles between stations.

Five busiest stations

Rank	Station	Trips	Share of all trips
1	Central Station	26,040	14%
2	Harbour Road	18,600	10%
3	Hill Street	16,740	9%
4	Market Square	14,880	8%
5	Riverside Park	13,020	7%

Table 2: Busiest stations by number of trips.

Five quietest stations

Rank	Station	Trips	Share of all trips
25	Old Fort	2,230	1.2%
24	Lakeview	2,790	1.5%
23	Mill Lane	3,350	1.8%
22	North Gate	3,720	2.0%
21	Quarry Road	4,090	2.2%

Table 3: Quietest stations by number of trips.

Rebalancing

Crews moved bicycles from full stations to empty ones several times a day. Quieter stations were mostly in outlying residential areas and beside the riverfront. The report does not record how many bicycle moves were carried out.

5. Safety and Maintenance

During the pilot, 37 bicycles were reported stolen and 112 were damaged. Maintenance crews took an average of 6 hours to respond to a reported fault. Riders are asked to check brakes and tyres before each ride.

No serious injuries were reported during the pilot. Helmets were not supplied with the bicycles; riders were encouraged to bring their own.

Reporting and handling faults

Riders could report a fault through the mobile app or by pressing the help button on a docking station. A reported bicycle was locked out of use until a maintenance crew had inspected it. Crews worked from a single depot and travelled to stations by van.

Reported faults by type

Fault type	Share of reported faults
Tyres	38%
Brakes	27%
Chain and gears	15%
Baskets and lights	12%
Other	8%

Table 4: Reported faults by type.

Damage and response times

The most common damage was to tyres, brakes and baskets, in line with the fault types shown in Table 4. Damaged bicycles were withdrawn from service until they had been repaired. The 6-hour average response time covers the period between a rider reporting a fault and a crew arriving at the station. The report does not give a separate figure for urgent faults.

Theft

Stolen bicycles were reported to the police and removed from the fleet records. The report does not state how many stolen bicycles were recovered.

Safety guidance

Safety information, including the advice to check brakes and tyres, was shown on every docking station panel and in the mobile app. Riders were also reminded to follow local road rules.

6. User Feedback

A survey of 1,200 users found that 78% were satisfied with the service. The most common complaint, raised by 31% of respondents, was bicycle availability during peak hours. Several users requested night-time availability.

How the survey was run

The survey was carried out in the last month of the pilot, online and at docking stations. The 1,200 respondents represent about a tenth of the 12,500 registered users. Respondents chose whether to take part, so the results may not reflect the views of every registered user.

Overall satisfaction

Response	Share of respondents
Satisfied	78%
Neutral	15%
Dissatisfied	7%

Table 5: Overall satisfaction with the service.

Main complaint

Main complaint	Share of respondents
Bicycle availability at peak hours	31%
Docking station locations	18%
Mobile app problems	14%
Bicycle condition	12%
Other	25%

Table 6: Main complaint raised by respondents.

What riders liked

Respondents most often praised the ease of registration and the convenience of short trips between stations.

Other suggestions

Other suggestions included more stations in residential areas and larger baskets. Respondents who reported app problems most often mentioned slow unlocking at busy stations. The survey did not ask about age, occupation or income.

7. Costs and Revenue

Of the INR 2.4 crore grant, INR 1.5 crore went to bicycles and docking stations and INR 0.9 crore went to operations. Fare revenue during the pilot was INR 0.31 crore.

Grant and revenue

Item	INR crore
Bicycles and docking stations	1.50
Operations	0.90
Total grant	2.40
Fare revenue (reported separately)	0.31

Table 7: Grant spending and fare revenue.

What operations covered

Operations covered station staff, maintenance crews, insurance, the mobile app and the customer helpline. Fare revenue is reported separately and is not part of the grant figures above.

Operations cost	INR crore
Station staff	0.40
Maintenance crews	0.25
App and customer helpline	0.17
Insurance	0.08
Total operations	0.90

Table 9: Operations spending by category.

Cost per trip

Spread across 186,000 trips, the grant works out at roughly INR 129 per trip.

Second-phase costs

The report does not include cost estimates for a second phase. These would need to be prepared if the city council decides to proceed.

8. Next Steps and Limitations

The report recommends expanding to 40 stations in a second phase, subject to approval by the city council. No decision has been made yet.

Recommended next steps

- Improve availability at peak hours by increasing rebalancing at the busiest stations.
- Review the case for night-time operation.
- Shorten the time taken to respond to reported faults.
- Prepare cost estimates for a second phase before the council decides.

Why these steps

Peak-hour availability was the most common complaint in the survey, so rebalancing at the busiest stations is the most direct way to address it. Night-time operation was requested by several users but would need its own cost and safety assessment. Faster fault response would keep more bicycles available to riders, and second-phase cost estimates are needed before the council can weigh the expansion. The report does not set a date for the council's decision.

Limitations

This pilot did not assess effects on traffic congestion or air quality. Findings are limited to six months, so seasonal effects over a full year are not known. Survey results come from respondents who chose to take part.

Questions the pilot did not answer

- How results would change over a full year of operation.
- The age, occupation and other characteristics of riders, which were not collected.
- The cost of a second phase.

Data quality

Trip counts come from automated unlock and return records. The maintenance log was kept by crew leaders, so response times are averages of the entries that were recorded.

Conclusion

The pilot shows that Rivertown residents will register for and use a docked bicycle service, and it identifies practical areas for improvement. It does not by itself settle whether a permanent scheme should be adopted.
